The present consensus view of sea level rise is for at least one meter by the end of the century. But glaciologists that study Greenland and Antarctica, each time they do research, they find something new that's shocking. The fear now is that it may be 2 meters or 6.5 feet by the end of the century. That's a huge impact for coastal cities. This impact is not taken seriously enough. And 6.5 feet by end of century implies how much by 2035 and by 2050?
